## **LISTING OF CLAIMS:**

1. (previously amended) A method of photodynamic disruption of cellular organisms comprising:

applying a surface acting agent containing benzalkonium chloride at a concentration of between 0.001% to 1.0% to a cell membrane of a cellular organism, said surface acting agent disorienting a cell membrane so that said cell membrane no longer functions as an effective osmotic barrier;

passing a photosensitive material through the disoriented membrane and into the cell interior; and

applying light to the cellular organism to cause a cellular disruption of the cellular organism.

- 2. (Previously amended) The method of cellular organism disruption of claim 1 wherein the surface acting agent and the photosensitive material are provided in a combined solution.
- 3. (previously amended) The method of cellular organism disruption of claim 2 wherein the combined solution is provided in proximity to the cellular organism via a topical application.
- 4. (Previously amended) The method of cellular organism disruption of claim 1 wherein the step of applying the surface acting agent and the step of passing the photosensitive material is performed on cellular organisms located on a surface of a medical prosthesis.
- 5. (Original) The method of cellular organism disruption of claim 1 wherein the photosensitive material is monomeric, dimeric, or polymeric.
- 6. (currently amended) The method of cellular organism disruption of claim 1 wherein the cellular organism is associated with one of the following: a sterilization procedure, a biofilm eradication procedure, a treatment of an infection at a tissue site, eradication of cancer cells, and an air filtration/decontamination process.
- 7. (Original) The method of cellular organism disruption of claim 1 wherein the cellular organism is a microbe, a spore, a fungus, or a cancer cell.
- 8. (canceled)
- 9. (Original) The method of cellular organism disruption of claim 1 wherein the surface acting agent contains benzalkonium chloride provided in a concentration range of between 0.005% to 0.05%.
- 10. (Previously amended) The method of cellular organism disruption of claim 1 wherein the step of applying the surface acting agent precedes the step of passing the photosensitive material by between 1 to 30 minutes.

- 11. (Previously amended) The method of cellular organism disruption of claim 1 wherein the step of applying light to the cellular organism occurs for a period of between 5 seconds to 1 hour and results in cellular organism death.
- 12. (Original) The method of cellular organism disruption of claim 1 wherein the step of applying a light includes a light wavelength ranging from 450 nm to 780 nm and a light dosage ranging from 10 J/cm<sup>2</sup> to 100 J/cm<sup>2</sup> and a light dosage rate ranging from 50 mw/cm<sup>2</sup> to 250 mw/cm<sup>2</sup>.
- 13. (Previously amended) The method of cellular organism disruption of claim 1 wherein the step of applying the surface acting agent includes providing more than one of a plurality of different surface acting agents.
- 14. (Previously amended) The method of cellular organism disruption of claim 13 wherein the step of passing the photosensitive material includes providing more than one of a plurality of different photosensitive materials.
- 15. (previously amended) A method of photodynamic disruption of organisms comprising:

topically applying a surface acting agent containing benzalkonium chloride at a concentration of between 0.001% to 1.0% to a cell site with an organism, said surface acting agent disorienting a membrane of the organism so that said membrane no longer functions as an effective osmotic barrier;

passing a photosensitive material in association with the organism, said photosensitive material being accumulated within the membrane of the organism; and

applying light to the organism to cause a disruption of the organism.

- 16. (previously amended) The method of organism disruption of claim 15 wherein the surface acting agent and the photosensitive material are in a combined solution.
- 17. (canceled)
- 18. (previously amended) The method of organism disruption of claim 15 wherein the step of applying the surface acting agent and the step of passing the photosensitive material-occurs on a surface of a medical prosthesis.
- 19. (currently amended) The method of organism disruption of claim 15 wherein the organism is associated with one of the following: a sterilization procedure, a biofilm eradication procedure, an air filtration / decontamination device, and a treatment of an infection at a tissue site.
- 20. (previously amended) The method of organism disruption of claim 15 wherein the photosensitizing agent is monomeric, dimeric, or polymeric.
- -21. (canceled)

- 22. (previously amended) The method of organism disruption of claim 15 wherein the benzalkonium chloride is provided in a concentration range of between 0.005% to 0.5%.
- 23. (previously amended) The method of organism disruption of claim 15 wherein the step of applying light results in organism destruction.
- 24. (previously amended) The method of organism disruption of claim 15 wherein the step of applying light occurs for a period of between 5 seconds to 1 hour and results in organism death.
- 25. (previously amended) The method of organism disruption of claim 24 wherein the step of applying light occurs for a period of between 2 to 20 minutes.
- 26. (previously amended) The method of acellular disruption of claim 15 wherein the step of applying the surface acting agent precedes the step of providing the photosensitive material by between 1 to 30 minutes.
- 27. (previously amended) The method of organism disruption of claim 15 wherein the step of applying the surface acting agent includes applying more than one of a plurality of different surface acting agents.
- 28. (previously amended) The method of organism disruption of claim 15 wherein the step of passing the photosensitive material includes passing more than one of a plurality of different photosensitive materials.
- 29. (previously amended) The method of organism disruption of claim 15 wherein the step of applying a light includes a light wavelength ranging from 450 nm to 780 nm and a light dosage ranging from 10 J/cm<sup>2</sup> to 100 J/cm<sup>2</sup> and a light dosage rate ranging from 50 mw/cm<sup>2</sup> to 250 mw/cm<sup>2</sup>.
- 30. (previously amended) The method of organism disruption of claim 15 wherein the organism is from a group containing: a virus, a spore, and a plasmid.
- 31. (previously amended) A method of photodynamic disruption of cells comprising the steps of:

identifying an area of cell activity;

applying a concentration including a combination of a benzalkonium chloride compound at a concentration of between 0.001% to 1.0% and a photosensitive material to the area of cell activity, said benzalkonium chloride compound disorienting a cell membrane so that said membrane no longer functions as an effective osmotic barrier, and so that said photosensitive material is able to pass through the disoriented cell membrane; and

exposing the area of cell activity to light having a light wavelength, a light dosage and a light dosage rate to cause photodynamic cellular disruption.

- 32. (Previously amended) The method of photodynamic disruption of cells of claim 31 wherein the step of identifying an area of cell activity includes an examination and identification of a cell site on a living body, and the step of applying the concentration includes an application of the concentration to the cell site of the living body.
- 33. (Original) The method of photodynamic disruption of cells of claim 31 wherein the step of identifying an area of cell activity includes identifying a medical prosthesis or device for sterilization procedure, and the step of providing the concentration includes an application of the concentration to a cell site of the prosthesis.
- 34. (Original) The method of photodynamic disruption of cells of claim 31 wherein the step of identifying an area of cell activity includes identifying an air filtration/decontamination device, and the step of providing the concentration includes an application of the concentration to a cell site within the device.
- 35. (canceled)
- 36. (canceled)
- 37. (canceled)
- 38. (canceled)
- 39. (canceled)
- 40. (previously amended) A method of photodynamic eradication of organisms within a biofilm of a medical prosthesis, said method comprising the steps of:

applying a photosensitive material and a surfactant to a surface of the prosthesis supporting a biofilm;

allowing the surfactant to disrupt membranes of the organisms within the biofilm;

waiting a period of time until the photosensitive material accumulates within the organisms;

providing a source of light illumination having predetermined light characteristics; and

illuminating the organisms within the biofilm layer with the light source to achieve a photodynamic eradication of organisms within the biofilm layer.

- 41. (previously amended) The method of claim 40 wherein the surfactant is benzalkonium chloride provided in at a concentration of between 0.001% to 1.0%.
- 42. (Previously amended) The method of claim 41 wherein the step of applying the photosensitive material and the surfactant is via an impregnation of compounds upon a surface of the prosthesis.

- 43. (Original) The method of claim 41 wherein the step of illuminating the biofilm layer is achieved by an internal illumination of the prosthesis.
- 44. (Original) The method of claim 41 wherein the step of illuminating the biofilm layer is achieved by an external light source illuminating the biofilm layer.
- 45. (Previously amended) A method of photodynamic eradication of organisms within a biofilm layer of an endotracheal tube, said method comprising the steps of:

providing a photosensitive material and a surfactant to a surface of the endotracheal tube supporting a biofilm layer;

accumulating photosensitive material within the organisms comprising the biofilm; allowing the surfactant to disrupt membranes of the organisms within the biofilm; waiting a period of time until the photosensitive material accumulates within organisms; providing a source of light illumination having predetermined light characteristics; and

illuminating the biofilm layer of the endotracheal tube with the light source to achieve a photodynamic eradication of organisms within the biofilm layer.

- 46. (previously amended) The method of claim 45 wherein the surfactant is benzalkonium chloride provided at a concentration of between 0.001% to 1.0%.
- 47. (Original) The method of claim 45 wherein the step of providing the photosensitive material and the surfactant is via an impregnation of compounds upon a surface of the endotracheal tube.
- 48. (Original) The method of claim 45 wherein the step of illuminating the biofilm layer is achieved by an internal illumination of the endotracheal tube.
- 49. (Previously amended) A method of photodynamic eradication of organisms within a biofilm layer of an intravascular catheter, said method comprising the steps of:

providing a photosensitive material and a surfactant to a surface of the intravascular catheter supporting a biofilm layer;

accumulating photosensitive material within organisms comprising the biofilm; allowing the surfactant to disrupt membranes of organisms within the biofilm;

waiting a period of time until the photosensitive material accumulates within the membranes of organisms within the biofilm;

providing a source of light illumination having predetermined light characteristics; and

4 - 1 - 4

illuminating the biofilm layer of the intravascular catheter with the light source to achieve a photodynamic eradication of organisms within the biofilm layer.

- 50. (previously amended) The method of claim 49 wherein the surfactant is benzalkonium chloride provided at a concentration of between 0.001% to 1.0%.
- 51. (Original) The method of claim 49 wherein the step of providing the photosensitive material and the surfactant is via an impregnation of compounds upon a surface of the intravascular catheter.
- 52. (Original) The method of claim 49 wherein the step of illuminating the biofilm layer is achieved by an internal illumination of the intravascular catheter.
